Ornamental Fish Import/ Export Wholesale Rare Fish Specialist

Limnopilos naiyanetri

Described in 1991, *Limnopilos naiyanetri* Chaung & Ng, has only just been discovered by the hobby. Crabs are found in pure freshwater in the roots of floating vegetation, ie. water hyacinth (*Eichornia crassipes*) and fine-leaved aquatic plants along the riparian zone (river banks). They have hairy bodies and appendages which collect mud and dirt and may function to trap food particles. They are not carnivorous, and behave like *Caridina* shrimps in their scavenging behaviors, where care and feeding are probably the same. Suitable for nano-tanks, and is the first crab species available which has attributes suitable for such. In such tanks they will stay closely associated with mosses and fine leaved-plants. Max size 1 cm. (Photo C.Lukhaup, Text K.Diehl)

Maximum size	1 cm
Size available	0,3-0,5 cm
Origin	Thailand
